

要作用方式。

(3) 胶料能够在较短时间内实现不间断的相互混合,而且速度分布有序,轴向速度产生的拉伸作用促进了胶料在机筒内分散混合,胶料混炼更均匀。

Abstract: The transient flow field in the feeding zone of $\Phi 200$ single screw extruder mixing for 1 s was simulated and analyzed by using professional viscoelastic fluid software Polyflow. The results showed that, by using double helix structure in feeding zone, the distribution of shear rate was a broader, the force of the screw on the compound was enhanced, the performance of plasticizing and mixing was improved. In the mixing process, the compound was stretched repeatedly and backmixed, so that good mixing result was obtained.
